A pixel is not a pixel

Peter-Paul Koch

BlackBerry Jam, 6 February 2012
I. Pixels
“The reference pixel is the visual angle of one pixel on a device with a pixel density of 96dpi and a distance from the reader of an arm's length. For a nominal arm's length of 28 inches, the visual angle is therefore about 0.0213 degrees. For reading at arm's length, 1px thus corresponds to about 0.26 mm (1/96 inch).”

Source: http://www.w3.org/TR/css3-values/#reference-pixel
Pixels according to W3C

Source: http://www.w3.org/TR/css3-values/#reference-pixel
Pixels according to W3C

• So the pixel is a certain angle in your view
• which means you cannot zoom it
• Some say you shouldn’t take it too literally, and zooming is allowed
• but if that’s so, why bother with this definition in the first place?
A pixel is not a pixel

- CSS pixels
- Density-independent pixels
- Device pixels

None of these have anything to do with W3C’s definition.

And you already know what CSS and device pixels are. You just don’t realise it.
• CSS pixels are the ones we use in declarations such as width: 190px or padding-left: 20px

• They are an abstract construct

• Their size may be increased or decreased
Mobile is becoming increasingly important to web designers and developers because users expect a site to work on their phones. Simultaneously, the web is becoming increasingly important to the mobile world because it is the only way to deploy an application to any phone.

Nowadays most web conferences feature a mobile session, and most mobile conferences a web session. The obvious next step is Mobilism: a conference wholly dedicated to mobile web design and development.

Just like in 2011 we’ll invite some of the best speakers from the web development and the mobile world to guide you through the confusing jumble of platforms, screen sizes, and browsers that is the mobile ecosystem.

Mobile is becoming increasingly important to web designers and developers because users expect a site to work on their phones. Simultaneously, the web is becoming increasingly important to the mobile world because it is the only way to deploy an application to any
Device pixels

- Device pixels are the physical pixels on the device
- There’s a fixed amount of them that depends on the device
Device pixels

320px
Device pixels

• But ...

• Devices get higher and higher pixel densities

• The number of device pixels also increases

• But that would break sites
Device pixels

640px
Density-independent pixels
Density-independent pixels

• Thus device vendors created density-independent pixels (dips)
• They are another abstraction layer
• The number of dips is equal to the number of CSS pixels that is optimal for viewing a website on the device.
• What does that mean? I’ll explain later
What kind of pixels?

If a certain JavaScript property is expressed in pixels, always ask yourself what kind of pixels.

Usually it’s CSS pixels, especially for anything related to CSS.

Sometimes it’s device pixels or dips, for anything related to screen size.
II. Viewports
Viewports

• The viewport is the total amount of space available for CSS layouts

• On the desktop it’s equal to the browser window

• The <html> element has an implicit width: 100% and spans the entire viewport
Mobile is becoming increasingly important to web designers and developers because users expect a site to work on their phones. Simultaneously, the web is becoming increasingly important to the mobile world because it is the only way to deploy an application to any phone.

Nowadays most web conferences feature a mobile session, and most mobile conferences a web session. The obvious next step is Mobilism: a conference wholly dedicated to mobile web design and development.

Viewports

• On mobile it’s quite a bit more complicated
• If the (narrow) browser window were to be the viewport, many sites would be squeezed to death
• And mobile browsers must render all sites correctly, even if they haven’t been mobile-optimized
Mobile is becoming increasingly important to web designers and developers because users expect a site to work on their phones. Simultaneously, the web is becoming increasingly important to the mobile world because it is the only way to deploy an application to any phone.

Nowadays most web conferences feature a mobile session, and most mobile conferences a web session. The obvious next step is Mobilism: a conference wholly dedicated to mobile web design and development.

Viewports

• Initially most browsers make the visual viewport equal to the layout viewport
• by zooming the page out as much as possible
JavaScript properties

window.innerWidth and window.innerHeight

- The width and height of the visual viewport in CSS pixels
- Works everywhere, except on Android 2, Firefox, and IE9.
III. Zooming
Zooming

- On the desktop the viewport becomes less wide and the CSS pixels become larger.
- The same amount of device pixels now contains less CSS pixels, after all.
- So padding-left: 34% is recalculated,
- and width: 190px now covers more device pixels

Zooming

• On mobile the visual viewport becomes smaller, but the layout viewport remains static. Thus CSS declarations are not re-computed.

• The visual viewport now contains less CSS pixels.

• The user sees less of the complete site.
Mobile is becoming increasingly important to web designers and developers because users expect a site to work on their phones. Simultaneously, the web is becoming increasingly important to the mobile world because it is the only way to deploy an application to any phone.

But which viewport? Visual? Layout?

media types, the box is fixed with respect to the viewport and does not move when scrolled.”

Source: http://www.w3.org/TR/CSS2/visuren.html#positioning-scheme
position: fixed

- Browser-dependent
- Most browsers use the visual viewport (Android 3, Chrome, BlackBerry, IE10, Safari iOS 6)
- others the layout viewport (Tizen, MeeGo, UC, IE9)
- Opera “hops”
Demo time

- http://quirksmode.org/m/tests/positionfixed.html
V. Media queries
Media queries

@media all and (max-width: 600px) {
  .sidebar {
    float: none;
  }
}
Media queries

- There are two important media queries:
- width (min-width and max-width)
- device-width (min-device-width and max-device-width)
- width is the one you want
Media queries - device-width

- device-width gives the width of the device screen
- in device pixels
- Equal to screen.width

Media queries

• width is the media query you want
• but at first sight it seems to be totally useless on mobile
• Usually we don’t care about the width of the layout viewport
• but with responsive design we care a lot
• We need to treat one more element
VI. Meta viewport
Meta viewport

<meta name="viewport"
    content="width=device-width"/>
Meta viewport

@viewport {
    width: device-width;
}

Only Opera for now
Meta viewport

<meta name="viewport"
content="width = device-width">

- The meta viewport tag tells the browser to set the size of the layout viewport
- You can give a pixel value
- or device-width, which means the screen size in dips (or device pixels)
